

Robotto Establishes Ukrainian Subsidiary to Develop Drone Software at the Front Line

Final Frontier and EIFO Back Robotto UA to Accelerate Combat-Proven Drone Intelligence

Aalborg, Denmark – 05 March 2026 – In the midst of the world's most intense drone war, Danish drone software company [Robotto](#) is now establishing a subsidiary in Ukraine under the name Robotto UA. This is happening with support from [Final Frontier](#), which invests in European space and defence technology, as well as the [Danish Export and Investment Fund](#) (EIFO).

In Ukraine's continued fight for freedom and independence, drones play a wholly decisive role on the battlefield. Here, Danish company Robotto contributes leading software for drones that functions as the drone's "brain", making it possible to automatically recognise hostile soldiers and other targets — even in complex environments.

This means the drones can operate more autonomously, with less human involvement, respond faster, and strike more precisely at the front line. At the same time, Robotto's software makes the drones more resistant to jamming, which poses a major challenge in modern warfare.

According to [Kenneth Richard Geipel](#), co-founder and CCO of Robotto, this type of technology can only be developed effectively in close collaboration with those who use it in practice:

"Ukraine is today the epicentre of military drone innovation. If we want to develop technology that works under the most demanding conditions, we need to be present where it is used. With Robotto UA, we are anchoring our development in the Ukrainian ecosystem and contributing concretely to Ukraine in the war against Russia — while also strengthening capabilities that are absolutely crucial for Denmark and our NATO allies."

— Kenneth Richard Geipel, Co-Founder & CCO, Robotto

The operational presence in Ukraine is also crucial for the investor Final Frontier:

"Final Frontier invests in companies that strengthen Danish and European combat capability. We need to get Europe back in the driver's seat. One of the most significant areas is drone technology. We have been following Robotto for some time and are impressed by the founders and their team. Robotto's control software for drones and counter-drones is in combat daily in Ukraine and is considered among the world's leading. The leading position is not a given — it requires pace, capital, and the willingness to push development all the way to the front line. With this investment, we are helping to establish Robotto in Ukraine so that technology development reaches the front line, and they maintain their lead. We see this as a strong contribution to Ukraine's fight and to increasing Denmark's and NATO's strength in this area."

— [Niels Vejrup Carlsen](#), Founding Partner, Final Frontier

Investment in European Security and Resilience

Robotto has been collaborating with Ukrainian drone manufacturers and operational units since Russia's full-scale invasion. The collaboration began when a former Danish soldier with ties to Ukraine contacted the company with a concrete request to bring the technology into use at the front line.

This marked the beginning of a close development process in direct collaboration with Ukrainian partners — an effort that is today backed by EIFO with a focus on strengthening both Ukraine's resilience and Denmark's long-term security interests.

"We have known Robotto since 2022, when they received a growth loan from us. I am pleased to see how they are now taking an ambitious and courageous step into Ukraine. I hope that Robotto's advanced software will benefit local drone products while also securing Danish access to valuable frontline experience. This is precisely the intention behind EIFO's investment guarantee in Ukraine, where we enable companies to enter a very uncertain, but also enormously exciting market."

— [Peder Lundquist](#), CEO, EIFO

The technology builds on the same core software that has previously been used in civilian contexts — including to identify and rescue animals during wildfires. The experience from this has been further developed and adapted for use under far more demanding conditions at the front line.

The establishment of Robotto UA is a natural next step in the company's work in Ukraine. With a permanent local presence, development, testing, and implementation can take place in close dialogue with the units and manufacturers that use the technology in practice — and where the needs arise.

Facts: Software for Collective European Security

- Robotto's software is developed with interoperability as a core principle. This means the system is designed to integrate with existing drone platforms and the way they are already used — across manufacturers and countries. In practice, the software can therefore be applied to multiple types of drones without extensive modifications. This is crucial for NATO countries, where joint operations require that technology functions seamlessly across borders.
- Experiences and feedback from Robotto's Ukrainian subsidiary are continuously incorporated into further development. The operational experience from the front line strengthens the company's "interoperability by design" approach and contributes to increasing the robustness of systems used for precision operations.
- By building interoperability in from the start, Robotto reduces implementation time, simplifies training, and makes it possible to rapidly scale the solution across platforms, countries, and alliances — thereby supporting NATO's overall resilience.

About Robotto

Founded by engineers from Aalborg University, Robotto builds autonomy software for unmanned systems. Built around the Robotto Autonomy OS — a platform-agnostic operating system for drones and unmanned vehicles — Robotto's software enables autonomous target recognition, navigation, and mission execution without GPS or continuous operator control, in the exact environments where conventional systems fail. The technology has been operationally deployed alongside Ukrainian frontline units since 2022 and was selected for NATO DIANA 2026, chosen among 150 companies from 3,680 submissions across 24 NATO nations. Through its Ukrainian subsidiary Robotto UA, established with support from Final Frontier and EIFO, frontline feedback flows directly into product development — compressing iteration cycles that would otherwise take years. www.robottto.ai

About Final Frontier

Final Frontier is a Danish venture capital fund investing in European startups specialising in space and defence technologies. Founded in 2024 with €4.5 million in capital under management, the fund focuses on pre-seed and seed-stage investments across the European space and defence value chain. Notable investors include former NATO Secretary General Anders Fogh Rasmussen, who has emphasised that "developing a strong and resilient defence industry requires private capital."
